Въпрос 4

What will happen if we try use the `std::sort()` from the `<algorithms>` header to a standard `std::list`?

Отговори

- ☐ The list will be sorted normally, but this will work only for integers;
- ☒ The list cannot be sorted using the `std::sort()` from the `<algorithm>` header, because the list can not use `RandomAccessIterator`;
- ☐ The list will be sorted normally, because the list has member functions `begin()` and `end()`;
- ☐ The standard C++ can not be sorted;
